

IDEFIX User Days

Tutorial: Usage I

Jonah Mauxion

Setup directory

Header file

Summary

MANDATORY
OPTIONAL

Contains major global parameter which strongly affect the code structure

Header file from isothermal SOD test

```
definitions.hpp
1  #define COMPONENTS 2
2  #define DIMENSIONS 1
3  #define ISOTHERMAL
4
5  #define GEOMETRY CARTESIAN
6
```

Number of vector components

\geq

Setup dimensions

Setup is isothermal

Setup geometry

Any modification requires compilation

POLAR (3D) \neq CYLINDRICAL (2D, right-handed)

Input file

Summary

Input file from
isothermal SOD test

Defines the setup physical and numerical properties

```
idefix.ini
1  [Grid]
2  X1-grid    1  0.0  500  u  1.0
3  X2-grid    1  0.0  1    u  1.0
4  X3-grid    1  0.0  1    u  1.0
5
6  [TimeIntegrator]
7  CFL        0.8
8  tstop      0.2
9  first_dt   1.e-4
10 nstages    2
11
12 [Hydro]
13 solver     roe
14 csiso      constant  1.0
15
16 [Boundary]
17 X1-beg     outflow
18 X1-end     outflow
19 X2-beg     outflow
20 X2-end     outflow
21 X3-beg     outflow
22 X3-end     outflow
23
24 [Output]
25 vtk       0.1
26 dmp       0.2
```

Global grid configuration

Integration method and parameters

Hydro parameters, additional physics

Boundary conditions for each direction

Output properties

Bedrock of input
file. Additional
sections for
additional physics/
numerics

No need to recompile when modified

Input file

[Grid] section

MANDATORY
OPTIONAL

Each entry can be a succession of contiguous patches

Number of patches

```
idefix.ini
1  [Grid]
2  X1-grid  #patches xbeg #cells spacing xend (#cells spacing xend ...)
3  X2-grid  ...
4  X3-grid  ...
```

One entry per direction

Patch beginning in the
coordinate system (once)

Number of cells
in the patch

Spacing type
(u,l,s \pm)

Patch end in the
coordinate system

Stretch requires
uniform patch from
left (s-) or right (s+)

Input file

[Grid] section - examples

Isothermal SOD test

```
idefix.ini
1 [Grid]
2 X1-grid 1 0.0 500 u 1.0
3 X2-grid 1 0.0 1 u 1.0
4 X3-grid 1 0.0 1 u 1.0
```

Unused
as the setup is 1D

Core collapse model

```
idefix.ini
1 [Grid]
2
3 X1-grid 2 1.0 512 l 10000.
4 X2-grid 3 0.0 32 s+ 1.2707963267948965 64 u 1.8707963267948966 32 s- 3.14159265358979
5 X3-grid 1 0.0 64 u 6.283185307179586
```

Input file

[TimeIntegrator] section

MANDATORY
OPTIONAL

Isothermal SOD test

```
6 [TimeIntegrator]
7 CFL 0.8
8 tstop 0.2
9 first_dt 1.e-4
10 nstages 2
```

Should be <1 to ensure stability

Final integration time in code units

IDEFIX compute dt from previous cycle

Number of sub-cycles

Also: fixed_dt, CFL_max_var, max_runtime...

Input file

[Hydro] section

MANDATORY
OPTIONAL

Isothermal SOD test

```
12 [Hydro]
13 solver roe
14 csiso constant 1.0
```

Solver type (HD or MHD)

Prescribed value: constant+value or userdef

When isothermal

Input file

[Hydro] section

MANDATORY
OPTIONAL

AmbipolarWind test

MHD only

```
14 [Hydro]
15 solver
16 ambipolar
17 gamma
    hlld
    explicit
    1.0001
```

Diffusion term (resistivity, hall, viscosity...)

Integration scheme

Prescribed value: constant+value or userdef

Prescribed value. Default is 5/3

When adiabatic.

userdef \Rightarrow function in setup file (Marc)

Input file

[Boundary] section

MANDATORY
OPTIONAL

Core collapse model

```
50 [Boundary]
51
52 X1-beg
53 X1-end
54 X2-beg
55 X2-end
56 X3-beg
57 X3-end
```

userdef
userdef
axis
axis
periodic
periodic

Two entries per dimension : left and right

Same as for [Hydro]

To include the axis

X2 from 0 to π

X3 from 0 to $2\pi/n$, n integer

If $n=1$, MPI decomposition is one or even

Last cells are copied in ghost cells

Also: outflow, reflective, shearing box

Input file

[Output] section

MANDATORY
OPTIONAL

Core collapse model

```
[Output]
analysis
vtk
dmp
uservar
50.
50.
100.
phiP Cs etaA
```

Analysis frequency (user-defined)

Output frequency, -1 to disable

List of additional user-defined variables
(stored in the vtk files)

Also: log entry with associated writing frequency
in number of integration cycles (default is 100)

Cmake tool

Summary

- Configuration can be done via three ways :
 - ▶ With Cmake through command line using : `cmake $IDEFIX_DIR -D options` (it's okay).
 - ▶ With Cmake through a graphic interface : `ccmake $IDEFIX_DIR`, where the options are to be set manually (the best !!!)
 - ▶ Using `idefix_cli`, a command line framework to configure, compile and run `idefix` : <https://idefix-cli.readthedocs.io/en/latest/>
- Main options are :
 - ▶ To enable MHD : `-D IDEFIX_MHD=ON`
 - ▶ To enable MPI decomposition : `-D IDEFIX_MPI=ON`
 - ▶ To trigger basic debug routine : `-D IDEFIX_DEBUG=ON`
 - ▶ To enable CUDA for GPU computation : `-D Kokkos_ENABLE_CUDA=ON`
 - ▶ With associated architecture : `-D Kokkos_ARCH_{...}=ON`
 - ▶ To list available options: `-LH`
- A *CMakeList.txt* can be added to the setup directory:
 - ▶ Used to replace source files by user-defined files, enable parameters...
 - ▶ Changes are taken into account by Cmake when configuring.

Cmake tool

CMakeLists.txt - Example

Core collapse model

CMakeLists.txt

```
1  # add specific source file to idefix build tree
2  replace_idefix_source(evolveStage.cpp evolveStage.cpp)
3  replace_idefix_source(dump.cpp dump.cpp)
4  replace_idefix_source(dumpImage.cpp dumpImage.cpp)
5  replace_idefix_source(dumpImage.hpp dumpImage.hpp)
6  replace_idefix_source(output.hpp output.hpp)
7  replace_idefix_source(output.cpp output.cpp)
8  replace_idefix_source(main.cpp main.cpp)
9  add_idefix_source("analysis.cpp")
10 add_idefix_source("analysis.hpp")
11
```

Cmake tool

Code generation with graphic interface

Page 1 of 8

1. Open graphic interface
2. Enable desired options
(MHD ? MPI ? GPU ?)
3. Configure
4. Check log (cheap)
5. Generate

- Compile and run the code :
 - ▶ `make -j #cpu`
 - ▶ `<path>/setup/idefix -options`
(see Marc's tutorial)

① **BUILD_SHARED_LIBS** OFF
BUILD_TESTING ON

CMake Version 3.25.2

Cmake tool

Code generation with graphic interface

1. Open graphic interface
2. Enable desired options
(MHD ? MPI ? GPU ?)
3. Configure
4. Check log (cheap)
5. Generate

- Compile and run the code :
 - ▶ `make -j #cpu`
 - ▶ `<path>/setup/idefix -options`
(see Marc's tutorial)

```
④ /linkhome/rech/genipa01/uzs72zf/src/idefix/src/dataBlock/evolveStage.cpp by
  evolveStage.cpp
    Replacing: /linkhome/rech/genipa01/uzs72zf/src/idefix/src/output/dump.cpp by
  dump.cpp
    Replacing: /linkhome/rech/genipa01/uzs72zf/src/idefix/src/utls/dumpImage.cpp by
  dumpImage.cpp
    Replacing: /linkhome/rech/genipa01/uzs72zf/src/idefix/src/utls/dumpImage.hpp by
  dumpImage.hpp
    Replacing: /linkhome/rech/genipa01/uzs72zf/src/idefix/src/output/output.hpp by
  output.hpp
    Replacing: /linkhome/rech/genipa01/uzs72zf/src/idefix/src/output/output.cpp by
  output.cpp
    Replacing: /linkhome/rech/genipa01/uzs72zf/src/idefix/src/main.cpp by main.cpp
  Adding problem-specific source file analysis.cpp
  Adding problem-specific source file analysis.hpp
Idefix final configuration
  MHD: ON (Vector potential)
  MPI: ON
  Reconstruction: Linear
  Precision: Double
  Version: v1.1.0-145-gcc4eb355
  Problem definitions: 'definitions.hpp'
Configuring done
```

CMake produced the following output

CMake Version 3.25.2

Press [e] to exit screen

CMake Version 3.2

Practice

Kelvin-Helmholtz Instability (KHI)

- Isothermal 2D setup in cartesian geometry
- Uniform grid, X ranging from 0 to 4 with 256 cells, Y from 0 to 1 with 64 cells
- Setup is HD : available solvers in the code documentation
- Constant isothermal sound speed of 10 in code units
- Setup is periodic in X, outflow in Y

Complete the setup KHI in:
.../idefix-days/tutorials/usage/KHI

Roadmap

1. Open graphic interface
 2. Enable desired options
 3. Configure
 4. Check log
 5. Generate
- Compile and run the code :
 - ▶ `make -j #cpu`
 - ▶ `<path>/setup/idefix -options`
